The Naval Surface Warfare Center in Dahlgren, Virginia, is hiring graduating computer science students to work alongside other computer scientists and engineers to develop a number of software tools which support testing and analysis of Navy systems. These tools will help better enable the end-users to conduct testing and analysis with an emphasis on ensuring naval combat systems can effectively exchange tactical data and exercise command and control functionality with other Navy, Marine Corps, Joint, and coalition units utilizing tactical data links and sensor and integrated fire-control networks. This group has rapidly expanded in the past year and is looking to grow further. They are interested in interviewing and hiring CS students (graduate and undergraduate) who will be graduating this May and are interested in a career of government service. Special emphasis in automatic testing, data analytics, software design, and software metrics.

Interested parties should send a resume to brian.s.dillon@navy.mil and Jeffrey.buziak@navy.mil.
