Division of IT
Virginia Tech Internship (available to undergraduate or graduate students)

This intern would work on compiling reports and statistical analysis as well as programming (JavaScript, HTML, and CSS) and business process modeling, design, and analysis. There is some mentorship involved since the work is varied. The following is a description of the position I would ask you to post or email wherever you would normally put internship or job-related info. Thanks for your time!

“The Division of IT at Virginia Tech has posted a paid internship available to undergraduate or graduate students. The work in this internship includes reporting and data analysis, programming (JavaScript, HTML, and CSS), and business process modeling, design, and analysis. The time commitment is 20 hours/week, and the compensation is $12/hr. The selected candidate can expect to build on or gain experience working on a team, web programming, designing business processes in a software system, and performing data-analysis/writing reports. While the work is recognizably varied, the selected candidate will receive mentorship by an IT professional to help them along.

A successful candidate should be dependable, organized, attentive to detail, excellent at verbal and written communication, and have the skills involved in doing the type of work expected (i.e., able to program in JavaScript/HTML/CSS; knowledge of foundational statistics; excellent knowledge of using Excel, and so on).

For more details and to apply, please see the ITE2 internship posting on it.vt.edu.
