

Are you looking to be challenged to work on cutting edge software technology? Do you want to be able to work with the top minds at IBM? Do you want to present your findings to top executives?

***Then Extreme Blue wants to talk to you.***

### What is Extreme Blue?

The program is IBM's top internship program. The Extreme Blue internship experience combines great talent and cutting edge technology to drive innovation.

Through the program, interns have submitted more than 500 patent disclosures and have made more than sixty contributions to the open source community. They helped create solutions for key clients and bring-to-market the next generation of IBM products. Not bad for just 12 weeks of work.

Unlike other intern programs that may relegate you to work on outdated technology, the Extreme Blue teams work on leading technology that helps grow your skills and evolve you into a more attractive candidate in the technology field. Interns in this high-performance environment get to roll up their sleeves and work with "hot" technologies such as Linux, Web 2.0, data analytics, virtualization, and web services.

Extreme Blue teams are like mini-businesses that must solve a problem or create a solution for a client. The interns work in small project teams that include business and technical students, along with IBM mentors. Each Extreme Blue team is part of a larger lab environment that includes approximately three other intern teams and a dedicated staff. This combination creates a team dynamic that fosters collaboration and helps interns create both a business and technical case for a project while setting aggressive goals to ensure the end deliverable is extreme enough to survive a competitive marketplace.

We are currently looking to staff 4 projects for the Fall program, in Austin, TX, to run From September 12-December 9, utilizing both operating system level and embedded Firmware programming, with a small need for higher level programming.
