Web Development/Entrepreneurial Project

My name is Benjamin LaBine and I’m an Industrial and Systems Engineering student here at Tech. I am looking for undergraduate students who have an extensive software background to work on a web development and entrepreneurial project. At the moment, another student and I are working with a high-profile company to make their existing website more user friendly as well as add several features. Simply put, their site is outdated and needs serious updates in terms of layout and design, but the logic and structure also needs updated. However, we don’t have all of the development experience necessary to accomplish the software side of the project.

We’re more than willing to go over additional details with anyone who may be interested, but high level commitment is necessary and previous experience with Apache, mySQL, and PHP or even HTML/CSS is a huge plus (the website is written using LAMP). This project will be a massive software development and entrepreneurial learning opportunity and have the potential to return significant monetary rewards.
